Laravel Telescope won't remove

Asked 1 year, 3 months ago Active 6 months ago Viewed 3k times

2

After running `composer remove laravel/telescope` It still won't remove telescope completely. I've followed the answer here <https://github.com/laravel/telescope/issues/361> but to no avail it still doesn't work. Here's the error message

```
telescope:install Install all of the Telescope resources
> illuminate\Foundation\ComposerScripts::postAutoloadDump
> @php artisan package:discover --ansi

In TelescopeServiceProvider.php line 10:

  Class 'Laravel\Telescope\TelescopeApplicationServiceProvider' not found

Script @php artisan package:discover --ansi handling the post-autoload-dump event returned with error code 1
C:\xampp\htdocs\laravelProjects\Project_KamotV2>php artisan

In TelescopeServiceProvider.php line 10:

  Class 'Laravel\Telescope\TelescopeApplicationServiceProvider' not found

C:\xampp\htdocs\laravelProjects\Project_KamotV2>
```

laravel

What laravel version are you using? – [aceraven777](#) Oct 4 '19 at 4:15

Can you check in your `config/app.php`, in the `providers` array if you included the laravel telescope there. – [aceraven777](#) Oct 4 '19 at 4:16

@aceraven777 I'm currently using the latest version which is 6.1.0. and yes I included `App\Providers\TelescopeServiceProvider::class` in the `config/app.php` I tried commenting it but nothing happened, no errors, telescope still there, nothing. I also tried following this [link](#) – [Steven](#) Oct 4 '19 at 5:12

You will have to remove that in the `app.php` – [aceraven777](#) Oct 4 '19 at 5:17

1 In your `app/Providers/AppServiceProvider.php` is there a `TelescopeServiceProvider` there? Remove that also. – [aceraven777](#) Oct 4 '19 at 6:13

You must first remove all the `telescope` reference in your code before running `composer remove laravel/telescope`.

1. Kindly check `config/app.php`, under `providers` array, remove the Telescope there

3. Remove telescope.php in config folder

Then finally you can run `composer remove laravel/telescope`.

also remove `public/vendor/telescope` – [famouspotatoes](#) Apr 27 '20 at 19:34

If you want to just disable Telescope temporarily, in your `composer.json` file add `laravel/telescope` to the `dont-discover` index:

```
"laravel": {
    "dont-discover": ["laravel/telescope"]
}
```

then run the `composer dump` command.

To permanently remove the telescope, run the `composer remove laravel/telescope` command, then remove `App\Providers\TelescopeServiceProvider::class`, from `config/app.php` file and delete `TelescopeServiceProvider` file from `app/providers/` folder.

This is what worked for me:

Inside:

```
root->config->telescope.php
```

in the `telescope.php` config file:

```
'enabled' => env('TELESCOPE_ENABLED', 'true'),
```

I changed the `true` to `false`.
